Annual Savings = Incremental annual (annualized) savings due to program in given year

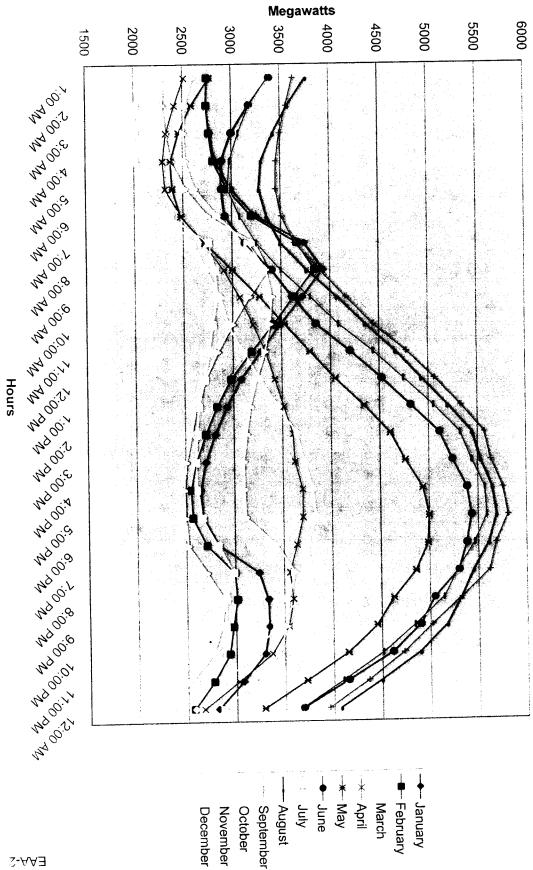

Cumulative Annual Effect = Cumulative sum of annual savings over multiple years (sum should be adjusted by measure life for measures with short lives, where appropriate)

Lifetime Savings = Savings over the life of the measures due to program in a given year (annual savings X weighted average measure life)

### Proposed Outline of Topics to be Covered in Staff's DSM Workshop Progress Report

- 1. Purpose, scope and expectations of workshops
- 2. Presentations
  - Utility DSM programs: APS, TEP, UNS, SWG, AEPCO
  - SWEEP
- 3. Overview of historical and current DSM activities and results
  - Developed spreadsheets for each utility
  - Common format for all reporting
- 4. Discussion of criteria for evaluating DSM opportunities
  - Developed a consensus of criteria for identifying and screening opportunities
- 5. Identification of "Best Opportunities" in each market segment
  - Response to Commissioner Hatch-Miller
  - Individual lists from each utility, other parties
- 6. DSM Proposals
  - Utilities and other parties
  - Common format for presenting proposals
- 7. Potential Future Activities
  - Discussion of funding mechanisms
  - Utility lost revenue/financial incentives
  - Measurement and validation
  - Cost effectiveness tests
- 8. Recommendations for moving forward

## APS Peak Day Load Curve 2002

S-AA3

### Arizona Corporation Commission DSM Workshop Comments February 13, 2004

### The active market of energy efficiency projects is much larger than the reports show

- Data presented does not take into account non-participant adopters
- · Results from DSM programs don't stand the test of time

### **APSES Experience**

- Surveys of prior participants show DSM installations have been modified
- Cheaper inefficient material have replaced DSM material
- · Control mechanisms are bypassed or disconnected
- Snapback effect supersedes conservation
- Maintenance and Operational behaviors have not been modified

### Issues of DSM may not be utility oriented

- · Customer behaviors are not changing. Consumers are indifferent
- · Rebates are ineffective
- Barriers for institutional customer adoption are legislative, not regulatory. (e.g., excess utilities, shared savings)
- Most effective adoption comes through Federal Regulations and city mandates (e.g., 1992 Energy Policy on HVAC equipment, building codes, Phase out of T12 lamp manufacturing in the US, etc.)

### Residential and Small C&I customers are best target markets for DSM

DSM programs seem to stick in this segment

### Large C&I customers are not motivated

- Utility costs represent less than 3% of overall operating costs for most
- Without a huge ROI (immediate payback), it's considered a lower priority

### MEMORANDUM

TO:

Barbara Keene and DSM Workshop Participants

FROM:

David Berry

DATE:

February 11, 2004

SUBJECT:

DSM Workshop Programs/Measures

I would like to propose a **Shade Tree** DSM program.<sup>1</sup> The shade tree program should be part of a more comprehensive residential retrofit program and shade trees should be included with a package of retrofit recommendations depending on characteristics of the houses. Shade trees provide the largest savings when the trees are planted on sun-struck sides of target houses. Target houses are:<sup>2</sup>

- Houses with dual cooling (evaporative cooling and air conditioning): best sites are houses with little or no window area on west facing walls but with a lot of window area on other walls.
- Houses having only air conditioning: best sites are houses with single pane windows and a lot of window area on the south facing wall.

Possible program features are shown in Table 1.

Table 1
Shade Tree Element of Residential Retrofit Program

Program Name	Description	DSM Measures	Other considerations	Participants (#/year)	Annual MW savings	Annual MWH savings	Annual cost
Shade trees	Component of residential retrofit package	Shade trees (!)	Largest savings occur when houses are targeted as described in text	10,000 houses assuming 3 trees per house	1.7 MW: greater savings at dual cooled houses	3,840 MWH; greater savings at dual cooled houses	\$300,000 excluding any rebate

Should be part of measurement and verification for residential retrofit package. May include spot field checks to ensure that trees are alive and properly located

Program implementation should include marketing and consumer education about selecting, locating, planting, and caring for trees. Implementation includes some spot verification that the trees are planted and located so as to cast shade on the house. These

<sup>&</sup>lt;sup>1</sup> The Arizona Republic ran an editorial on the values of shade trees on September 17, 2003. The editorial recommended that 30 percent of the Phoenix land area be covered with trees.

<sup>&</sup>lt;sup>2</sup> Kim Clark and David Berry, "Targeting Residential Conservation Measures," *Home Energy*, September/October 1994: 14-15. Kim Clark and David Berry, "House Characteristics and the Effectiveness of Energy Conservation Measures," *Journal of the American Planning Association*, vol. 61, Summer 1995: 386-395.

costs do not include any buydown or rebate of costs which are transfer payments. Thus a buydown or rebate could be added that would not decrease societal benefits, but which would increase utility costs.

Supporting analyses are presented below.

### **Shade Tree Benefits**

Trees provide the following benefits:<sup>3</sup>

- Reduced air conditioning load due to shade, evapo-transpirational cooling, and wind reduction
- Avoidance and uptake of air pollutants (particulates, ozone, nitrogen dioxide, sulfur dioxide and carbon monoxide)
- Reduced carbon dioxide in the atmosphere due to sequestration and avoided electricity generation
- Avoided runoff
- Wildlife and aesthetic benefits
- Increased property values capitalizing the energy savings and aesthetic benefits

Table 2 shows estimates of electricity savings from shade trees in dry climates.

### **Shade Tree Program Examples**

Shade tree programs have been pursued by Tucson Electric Power, Mohave Electric Cooperative, Alliant Energy, and the Sacramento Municipal Utility District, for example. The SMUD program started in 1990 and has resulted in planting of 330,000 trees on 110,000 sites. Some programs give trees away and others sell them at a discount. The SMUD program puts a heavy emphasis on consumer education (regarding how to plant and care for trees) and has a community forester site the trees at the customer's house or building to maximize energy savings. TEP works in partnership with Trees for Tucson and has planted more than 26,000 trees. Note that utility programs typically provide smaller trees so that it may take several years to achieve the energy saving potential of the trees.

Table 2
Electricity Savings Attributable to Shade Trees

Area	Reference	Savings
Phoenix	Kim Clark and David Berry, "Targeting Residential Conservation Measures," Home Energy, September/October 1994: 14-15. Kim Clark and David Berry, "House Characteristics and the Effectiveness of Energy Conservation Measures," Journal of the American Planning Association, vol. 61, Summer 1995: 386-395.	<ul> <li>3 large trees shading air conditioned houses         ✓ Average house: .05 kW and 36 kWh per year         ✓ Target house (single pane windows, more window area on south facing wall): 0.17 kW and 384 kWh per year</li> <li>3 large trees shading dual cooled houses (evaporative cooling and air conditioning)</li> <li>✓ Average house: .02 kW and 810 kWh per year</li> <li>✓ Target house (smaller fraction of west facing wall in windows, greater fraction of all walls in window area): 0.35 kW and 956 kWh per year</li> </ul>
Sacramento	James Simpson, "Urban Forest Impacts on Regional Cooling and Heating Energy Use: Sacramento County Case Study," <i>Journal of</i> <i>Arboriculture</i> , vol. 24, July 1998: 201-214.	<ul> <li>Reduction in kWh use for air conditioning due to existing trees:         <ul> <li>✓ For residential, commercial, and industrial buildings combined: 10.9%</li> <li>✓ For 1-4 family residences only: 21.3%</li> </ul> </li> <li>Reduction in peak air conditioning kW due to existing trees:         <ul> <li>✓ For residential, commercial, and industrial buildings combined: 6.1%</li> <li>✓ For 1-4 family residences only: 12.9%</li> </ul> </li> </ul>
Tucson	E. Gregory McPherson, "Evaluating the Cost Effectiveness of Shade Trees for Demand-Side Management," <i>The Electricity Journal</i> , vol. 6, no. 9, November 1993: 57-65.	Savings due to shade* from one deciduous tree opposite west wall of energy efficient 2 story home:  • 400 kWh saved per year for 24 foot tree (smaller savings for smaller trees)  • 0.5 kW savings for 24 foot tree (smaller savings for smaller trees)  * savings do not include savings attributable to evapo-transpirational cooling or reduced wind speed

### **Program Assumptions**

The costs and benefits of a shade tree program depend on the species to be planted, tree locations, tree size at planting (small or large enough to cast shade immediately), the assumed baseline (what would the property owner have done in the absence of the tree program), and other factors. Program assumptions, costs, and benefits are presented in Table 3 on a per-tree basis.

Table 3
Program Assumptions, Costs and Benefits per Shade Tree in Phoenix

-234	Factor 1994 - 1994	**Assumption of Result
1.	Baseline	No tree to be planted. If property owner was going a plant a tree in another location, the incremental costs might be less. If property owner gardens as a hobby, costs might be less.
2.	Cost of tree, increased by 25% to replace trees that die in first year	\$40 x 1.25 = \$50 (\$40 cost is for a 15 gallon sweet acacia; quote from Treeland in Mesa, January 2004)
3.	Years until shade is provided	5 years (would be less if a larger, more expensive tree were purchased)
4.	Planting cost	\$10 (see baseline assumptions)
5.	Annual water usage	1,200 gallons. Some trees might require less water after they are mature
6.	Annual O&M cost	\$1.00
7.	Life of tree	40 years
8.	kW savings	0.17/3 = 0.057 kW for one tree at a target air conditioned house per Clark and Berry study, Table 2 above*
9.	kWh savings	= 384 kWh per year/3 = 128 kWh per year for one tree at a target air conditioned house per Clark and Berry study, Table 2 above*
10.	Utility avoided capacity cost	\$63 per kW per year based on fixed costs of a new combustion turbine
11.	Utility avoided energy cost	\$0.03 per kWh for marginal units
	Incremental cost of water	\$1.32 per 1000 gallons (Scottsdale rate)
13.	Rate of inflation	2.5% per year
14.	Discount rate for present value	5.5%
15.	Present value of net benefits for one tree at a target house	\$25

<sup>\*</sup> larger savings would be obtained from targeted dual cooled houses.
